# Press Release

## **Xabler Video Server System to Allow Viewing of Security Cameras or Webcams on Any Mobile Device**

New VSS system will be available as add-on to Xabler servers or as stand-alone.

Provo, UT— Xabler announces the launch of Video Server System (VSS), slated for release in early 2004. The system displays live video from security cameras and webcams on virtually any mobile device—handhelds, cell phones, notebooks, tablets or laptops—via wireless connection.

VSS allows homeowners and/or security personnel to see live video anywhere a wireless signal is available. The system works with wireless LANs and wireless Internet for worldwide coverage, using the most powerful encryption available to protect your video from unauthorized viewing. AES encryption is available.

“The great thing about VSS is that it works with most devices people may already own or will acquire in the future,” explains Kent Gividen, Xabler CTO. “It’s a way to facilitate existing hardware to create a globally available wireless security system.”

The system also works with multiple cameras, allowing you switch from camera to camera with a tap. Pan, tilt & zoom can be controlled from the mobile device. You can also set your system to respond to motion sensitivity. If motion exceeds that level, the software takes actions you specify, including sending a pre-formatted e-mail and/or recording the event. The video can also record continuously or on a schedule, turning your PC into a powerful Digital Video Recorder. It’s a great solution for adding remote monitoring to almost any security system.

The VSS Server can be controlled by any PC or Win32 client with access to a wireless LAN and/or an Internet connection. It encrypts the video from your cameras to protect you from unauthorized viewing. The VSS Video Client resides on your PDA, Java-enabled cell phone or laptop. It lets you select which camera to view, then receives the encrypted video feed from the wireless LAN or Internet.

### **About Xabler**

Xabler of Provo, Utah was founded to meet the growing need of Wireless and IP-enabled control in home and business automation. The company focuses on ways to deliver quick conversion, seamless integration, and powerful control options to home and business customers.
